

Measuring bunker area ...

In order to calculate the right amount of material used in a bunker construction or renovation with Capillary Concrete, it is very important to measure the surface of the bunker base.

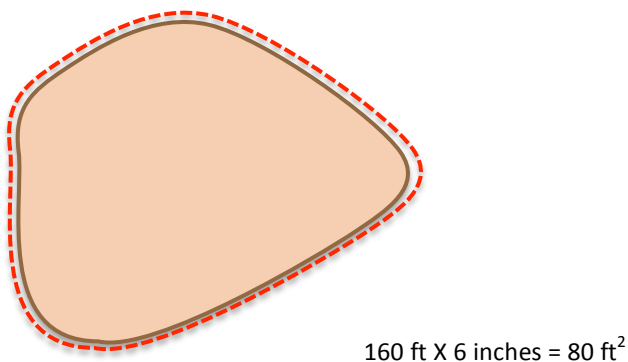

To measure the surface use the formula greatest Width in feet times greatest Length in feet, then take that value times 0,8.

Please note it is very important to measure on the surface to get the right surface value.

Please note that the difference in surface of the bunker in 3D versus 2D is +34%. It is of the greatest importance to measure the full area on the bottom of the bunker base.

To measure the circumference of a bunker for the **Capillary Concrete Bunker Edge** take a measuring wheel and run the circumference of the edge around the bunker. Then take the height of the bunker edge permanent grass times the full distance to get the total square footage of material needed.

The client is responsible for the correct measuring of all areas.
